DO NOT MAKE THE MISTAKE OF ONLY STUDYING THE QUESTIONS IN THIS SAMPLE TEST!!! On test #2, you are responsible for ALL MATERIAL up until the first PIC hardware lecture.

ECE 3724/CS 3124 Test #2 Sample – Summer 2004- Reese

You may NOT use a calculator. You may use only the provided reference materials. .

Part I: (70 pts)

a. (10 pts) Write a PIC18 assembly code fragment to implement the following: int k;

```
k=k-1; \\  \begin{tabular}{ll} movlw 0 & ; w=0; \\ decf & k,f & ; decrement LSByte \\ subwfb & k+1,f & ; decrement MSByte \\ \end{tabular}
```

b. (10 pts) Write a PIC18 assembly code fragment to implement the following: signed int j, k; char i;

```
do {
    i++;
}while (j > k);
```

```
loop_top
        incf i,f;
                            ;i++, a byte variable
        movf j,w
                             ; w = LSByte of j
        subwf k,f
                           ;k-j, LSByte
        subwf k,f ;k-j, LSByte
movf j+1,w ;w = MSByte of j
subwfb k+1,w ;k-j; MSByte;
               v 1
                           ;branch if v 1
        bn
               loop top
                           ;loop if v=0, N=1
               loop_exit
                             ; exit otherwise
        bra
V 1
                             ;loop if V=1, N=0
        bnn
               loop top
loop_exit
         ...rest of code....
```

c. (10 pts) Write a PIC18 assembly code fragment to implement the following: int k;

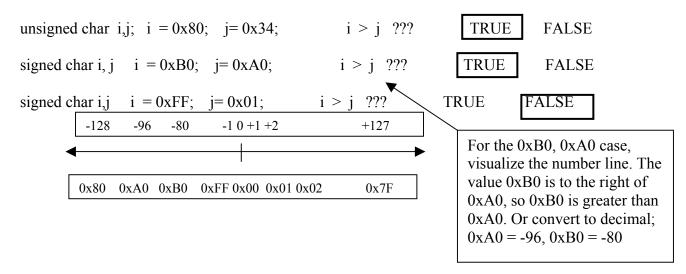

```
k = k << 2;
```

```
bcf STATUS, C
rlcf k,f
rlcf k+1,f ; k = k << 1
bcf STATUS,C
rlcf k,f
rlcf k+1,f ; k = k << 1</pre>
```

d. (10 pts) Implement the 'FILLSTR' subroutine in PIC18 assembly language.

```
parameter block for fillstr
                              CBLOCK 0x20
/* get string */
                                    ; s contains pointer to character string, c is fill character
                               s:2, c
fillstr (s,c)
                              ENDC
unsigned char *s;
unsigned char c
 while (*s != 0) {
   *_{S} = c:
  s++;
                             movf
                                       s,w
                                       FSR0L
                             movwf
                                       s+1,w
                             movf
                             movwf
                                       FSR0H
                                                       ; FSR0 = s
char *mystr = "Hello";
                        loop
main ()
                             movf
                                     INDF0, w
                             bz
                                     exit
                                                    ; exit if zero
 fillstr(mystr,0x20);
                             movf
                                     C,W
                             movwf POSTINCO
                                                             *s = c, s++
                             bra
                                     loop
// 0x20 = space char
                                                                  : same as
                        exit
                                                                                ; *_{S}=c
                                                                   movwf INDF0
                             return
                                                                   infsnz FSR0L,f
                                                                   incf FSR0H,f; FSR0++
                        main
                             movlw
                                       low mystr
                             movwf
                                       s;
                             movlw
                                      high mystr
                                       s+1;
                             movwf
                                       0x20
                                               ; space character
                             movlw
                             movwf
                                       fillstr
                             call
                               ...rest of code...
```

e. (10 pts) For each one of the following comparisons, indicate if the comparison is true or false.

f. (10 pts) Write a PIC18 assembly code fragment to implement the following: signed int j, k;

```
unsigned char i;
```

```
if (j != k) {
    i = i >> 1;
}
```

```
movf k,w
                          ;w = LSByte of j
        subwf j,f
                          ;j-k, LSByte
       bnz if body
                          ;branch if Z=0
       movf k+1,w
                          ; w = MSByte of j
        subwfb j+w,w
                          ;k-j; MSByte;
                          ; branch if Z = 1
             end if
         ; reach here if either subtraction nonzero
if body
       bcf
             STATUS, C
        rrcf i,f
                           ; i = i >> 1
end_if
        ...rest of code....
```

g. (10 pts) Write a PIC18 assembly code fragment to implement the following:

```
signed char i;
```

```
i = i >> 1;
```

Part II: (40 pts) Answer 7 out of the next 9 questions. Cross out the 2 questions that you do not want graded.

1. Give the machine code for the fragment below:

here bra here

The bra will branch one instruction word backwards, or -1 (bra -1), so machine code is:  $0 \times D7FF$ 

2. The value 0xE2 is a two's complement, 8-bit number. What is the decimal value?.

This is a negative number, as the MSB is set. So, magnitude is 0x00 - 0xE2 = 0x1E = 16+14 = 20. Final answer is -20.

3. The value of -128 in 8 bits two's complement is 0x80. What is the value as a 16-bit number?

In 16-bits, must use sign extension, answer is 0xFF80.

4. Give the result of the operation 0xB3 + 0x9A, and the V, N, C, Z flag settings.

0xB3 + 0x9A = 0x4D, C = 1, V = 1 (-N +(-N) = +N, wrong), N=0, Z = 0

5. Give the result of the operation 0x40 - 0xA3, and the V, N, C, Z flag settings

0x40 - 0xA3 = 0x9D, C = 0 (borrow), V = 1 (+N - (-N)) = (+N + (+N)), answer should be positive, but get a negative value, so answer is wrong. N = 1,Z = 0

6. What range of two's complement numbers can be encoded in 5 bits?

 $+15 \text{ to } -16 \quad (+2^{N-1}-1 \text{ to } -2^{N-1})$ 

7. When would a 'goto' instruction have to be used instead of a *bra* instruction?

If the jump target address was further away than +1023 or -1024 instruction words from the location of the bra instruction.

8. What are the table read/write instructions useful for?

Table reads are used to read a byte from program memory using the TBLPTR register. The value is read into the TABLAT register. They are useful for reading or writing values from/to program memory.

9. What is the limitation of the stack on the PIC18?

The stack can only store 31 return addresses. If 31 CALLS are made without a return, then the next call will cause stack overflow as there is no place to store the return address.
